TRAPPACK

The HIGHVAC TRAPPACK features an innovative filter media that utilizes a tortuous gas path through statically charged fibers to attract and hold submicron particles. This technology provides a substantially larger volume of open space, reduced conductance loss, and increased uptime compared to traditional single-size mesh filters. TRAPPACK particle traps are available in a number of different sizes with different filter densities to accommodate small applications or high volume industrial projects. Inquire about our high-flow coil-type TRAPPACKs for processes with a very high volume of particulate byproduct. Install at the inlet or exhaust of your vacuum pump as needed for each process.
